Application Architecture

Scraping ArXiv website

First of all we scrapped the arxiv website to collect the articles/research paper from AI, Data Science, Data Mining, Condensed Matter Physics and General Relativity and Quantum Computing

Data Preprocessing

Then we tokenize, stem, lemmatize and remove the stop words from the document. Then, we create the dictionary from all the tokens.

TF-IDF Score Calculation

Finally we use the dictionary and the tokens present in each document to create the tf-idf matrix. Moreover, functionally for query preprocessing has been included in the vector.

To-Do

1. First we will use a new idea of 2D ranking of the document, by giving the search result in 2 dimension rather than linear one dimension.
2. Also, we will add the GUI support for the whole search engine along with the visualization of the search being done in 2 dimension.
3. We will develop this in a custom made application made in plotly.
4. After that we will add a separate way of ranking the pages based on the principle component analysis instead of the cosine similarity.

Data Structures Used

Currently we are using the inbuilt/library imported data structures in our model for the following purpose:

1. **Word Vocabulary:** This is implemented as a hashtable with the python inbuilt dictionary to get the index of the each term in the tf-idf matrix.
2. **tf-idf matrix:** This is stored using the NumPy matrix with the terms/dictionary index in representing the row number and the document number representing the columns of the matrix.
3. **Query_vector:** This is a boolean vector for the query in the dictionary space i.e is the dimension of the vector is equal to the dictionary. This is also implemented with the numpy vector.
4. **Document-term list:** This is the list of list of all the document and their corresponding words/terms in the document.

Efficiency

(Corpus details)

- Total Corpus size: 500 research articles from [arXiv](#) website
- Total items in bag of words: 7968

(Search and Retrieval time)

- For the query “Machine Learning” - 0.0019s
- For the query “Artificial Intelligence” - 0.0018s
- For the query “Quantum Machine Learning” - 0.0019s
